Message Extension

Mailbox Extension is the ability of the Mimosa Archive to reduce the size of Exchange mailboxes and public folders by migrating older or larger attachments from Exchange to the Mimosa Archive. NearPoint replaces the attachments with stub files (pointer files) that redirect to the copy of the attachment stored in the Mimosa Archive.

You will still see the message in your mailbox after this migration has occurred, but with a different icon (marked in the image above) that indicates that the attachment has been migrated to the Mimosa Archive. Also, the subject line shows the number of bytes archived in the Mimosa Archive. **Note:** The icon indicating extended messages is not displayed in OWA. Only the subject line shows the number of bytes archived in the Mimosa Archive.
